

Biosketch: Dr. Daniel E. Keyler, FAACT

Dan has been actively involved with studying venomous snakes since he was a young boy. His interest in herpetology and the toxicology of venoms was spurred early on by the late Sherman A. Minton Jr., MD, a friend and mentor until his passing in 1999. Dan continues his lifelong interest in the conservation, and study of the timber rattlesnake (*Crotalus horridus*), and received multiple research grants for their study in the Upper Mississippi River Valley. He retired from Hennepin County Medical Center in 2009, but is currently active as Past President of the North American Society of Toxinology, a Fellow of the American Academy of Clinical Toxicology, and Adjunct Professor of Experimental and Clinical Pharmacology, University of Minnesota. He has contributed numerous scientific publications and book chapters involving immunotherapeutics, animal toxins, and venomous snakebite, and has coauthored two books, *Venomous Bites from Non-Venomous Snakes: A Critical Analysis of Risk Management of Colubrid Snake Bites*, and *Venomous Snakebite in the Western United States*. He served as Envenomation Section Chair with the American Academy of Clinical Toxicology 2002-07, and is an author and member of the Medical Advisory Committee to the Online Antivenom Index. Currently, he spends as much time out in the field as possible where he is most content.
